Investigation: Billi, HBSAG Test

TEST NAME	RESULT	UNIT	NORMAL RANGE
-----------	--------	------	--------------

### BIO-CHEMISTRY

Bilirubin Total	0.70	mg/dl	<1.1
-----------------	------	-------	------

Bilirubin is a yellowish substance produced during the breakdown of red blood cells. It's a key component of bile, a fluid that helps with digestion, and is processed by the liver. High bilirubin levels can indicate liver problems or other medical conditions, potentially causing jaundice (yellowing of the skin and eyes).

### SEROLOGY

HBs'Ag

'NEGATIVE'

**Hepatitis B surface antigen** a protein found on the surface of the Hepatitis B virus. It helps determine if someone has been infected with the virus and can indicate the presence of either an acute or chronic infection. A positive result means the person is contagious and has an active infection.

### Interpretation:

**Complete Blood Count (CBC)** helps understand the number, size, and characteristics of different blood cells, which can provide clues about overall health and potential conditions. It's a common test used to detect issues like anemia, infections, and other blood disorders.

**Reference ranges:** Labs may have slightly different reference ranges, so it's important to compare results to the specific lab's guidelines.

**Abnormal results:** Abnormal CBC results don't always mean there's a serious problem, and further investigation may be needed to determine the cause.
